Foreword	1
Abstract	3
Part One: TOPICS IN LAGOON MORPHODYNAMICS	5
1 Introduction	7
References	12
2 Tidal meandering channels	15
2.1 Introduction	15
2.2 Field evidence	18
2.3 Formulation of the problem	21
2.4 The basic flow and concentration fields	31
2.5 Linear solution	36
2.5.1 Linearization of eddy viscosity	49
2.6 Results for the flow and topography fields	50
2.7 The formation of tidal meanders: a ‘bend’ process?	66
2.8 Conclusions and future developments	73
References	77
3 Experimental investigation on tidal channels	81
3.1 Introduction	81
3.2 Theoretical framework	82
3.2.1 The hydrodynamic problem	83

3.2.2	Hydrodynamics of a weakly dissipative and weakly convergent channel: linear theory	86
3.2.3	The one dimensional morphodynamic problem	89
3.3	Scaling rules of physical models of tidal morphodynamics	93
3.3.1	The case of weakly dissipative estuaries	93
3.3.2	The case of strongly dissipative estuaries	97
3.4	Experimental setup and procedure	99
3.5	Control of the wave generating system	103
3.6	Experimental observations	104
3.6.1	Tidal wave hydrodynamics: the water surface elevation	104
3.6.2	Tidal wave hydrodynamics: the water speed	110
3.6.3	Tidal channel morphodynamics: preliminary obser- vations	113
3.6.4	Experimental observations near the channel inlet	114
3.7	Conclusions and future developments	118
References		122
Part Two: TOPICS IN FLUVIAL MORPHODYNAMICS		123
4	Bedload on arbitrarily sloping beds at low Shields stress	125
4.1	Introduction	125
4.2	The threshold condition for the motion of bedload particles on arbitrarily sloping beds	128
4.3	The direction and intensity of the velocity of saltating parti- cles in motion on arbitrarily sloping beds	134
4.4	Estimating the average areal concentration of saltating parti- cles by Bagnold's hypothesis: an approach which leads to unrealistic results	136
4.5	An alternative approach: the excess residual stress as a mea- sure of the entrainment capacity of the stream	143
4.6	Discussion and conclusions	149
